

Integrate customer approval and persistence services (Not implemented)

Date: 2022-06-05

Status: Accepted

Context

During our customer onboarding workflow we need to approve customers as well as persist them. Previously we made the decision to separate these two steps into two different services.

Decision

We integrate the customer approval- and customer persistence step into one service.

Consequences

The customer domain is thereby no longer split across multiple services and instead unified in one. This makes future additions easier, since it is clear which service is responsible. Also the resulting service is not as finegrained anymore which simplifies our architecture and more accurately mirrors our domain.

However, as a consequence a change in the approval process (which should be much more frequent than change in customer persistence) also constitutes a re-deployment of the customer persistence layer.
